Звіт

з лабораторної роботи № 3 з дисципліни
«Алгоритми та структури даних 2. Структури даних»

„ Прикладні задачі з теорії графів”

Виконав(ла)

ІІ-15 Пругатирьов Дмитро Валерійович

(шифр, прізвище, ім'я, по батькові)

Перевірив

Соколовський Владислав Володимирович

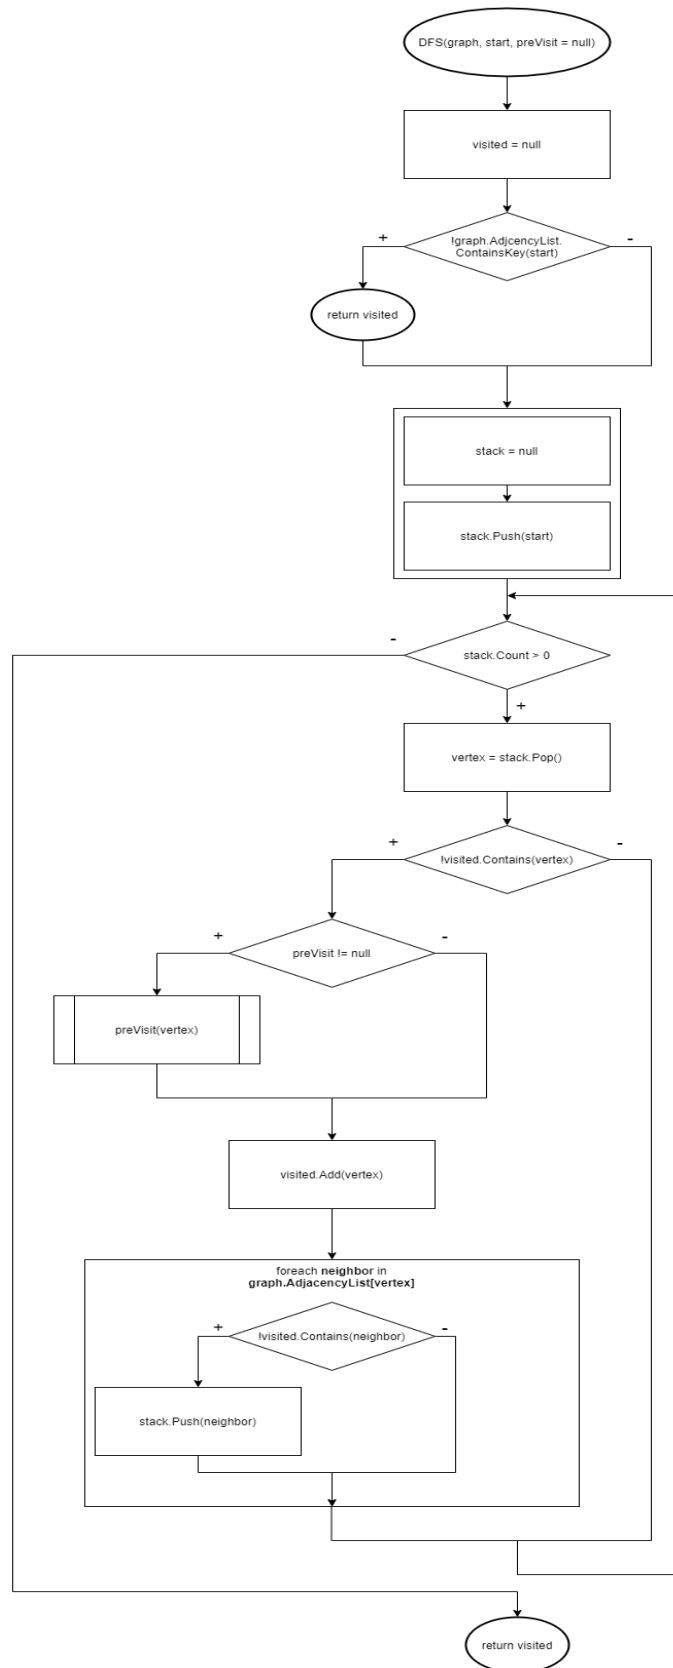

(прізвище, ім'я, по батькові)

Київ 2022

Варіант 25

Мета роботи – вивчити основні прикладні алгоритми на графах та способи їх імплементації.

Блок-схема алгоритму

Вихідний код

```
public class DFSalgorithm
{
    public static HashSet<T> DFS<T>(Graph<T> graph, T start, Action<T>
preVisit = null)
    {
        HashSet<T> visited = new();

        if (!graph.AdjacencyList.ContainsKey(start))
        {
            return visited;
        }

        Stack<T> stack = new();
        stack.Push(start);

        while (stack.Count > 0)
        {
            T vertex = stack.Pop();

            if (!visited.Contains(vertex))
            {
                if (preVisit != null)
                {
                    preVisit(vertex);
                }

                visited.Add(vertex);

                foreach (T neighbor in graph.AdjacencyList[vertex])
                {
                    if (!visited.Contains(neighbor))
                    {
                        stack.Push(neighbor);
                    }
                }
            }
        }

        return visited;
    }
}

Розв'язання задачі вручну

Висновок

На цій лабораторній роботі я реалізував алгоритм обходу графу в глибину (DFS), задаючи вершини графу матрицею суміжності автоматично або з користувацького надання даних. Цей алгоритм особливий тим, що не знаходить найкоротший прохід, а один з можливих. Програмне розв'язання задачі подібне до ручного, але дозволяє проводити розрахунки набагато швидше.
